

Step & continue

Run is coarse

Breakpoints and halt

- A breakpoint pauses Continue when simulation time reaches a chosen tick
- A system stop from the testbench is like a dynamic breakpoint
- Practice all three moves

INTERACTIVE TOOL

Step & continue

Document-aid literacy: **Step**, **Continue**, and **\$stop** / breakpoints (not a full debugger).

Starter: Step + Continue-to-bp practiced — READY.

Starter example: Step practiced · Continue hit breakpoint @5 — READY.

Challenges 0 / 22 cleared

Quiz: Step: Step...

☐ advances one conceptual time unit, then pauses

☐ deletes breakpoints

☐ only opens the Files pane

☐ compiles with -Wall

Core ideas

Step

One time unit, then pause.

Continue

Run until bp / \$stop / end.

Breakpoint

Pause when t hits the mark.

\$stop

TB/system halt of the run.

Lab starter

Public simulator practice

- In the public IDE
- Continue until you hit a deliberate stop in the testbench or a breakpoint you set
- Say whether you are paused after Step, continuing, or halted, and why

Pitfalls to watch

- Do not mash Run when you meant Step, you will overshoot the interesting edge
- Do not forget that Continue without a stop condition can race to the end of the window
- And do not confuse a halted session with a crashed compile

Your turn

- Complete the checklist for at least one track, preferably both
- Practice Step, Continue, and a halt once each
- When you are ready, take the short quiz, then continue to poke, force, and release
