

Simulator path complete

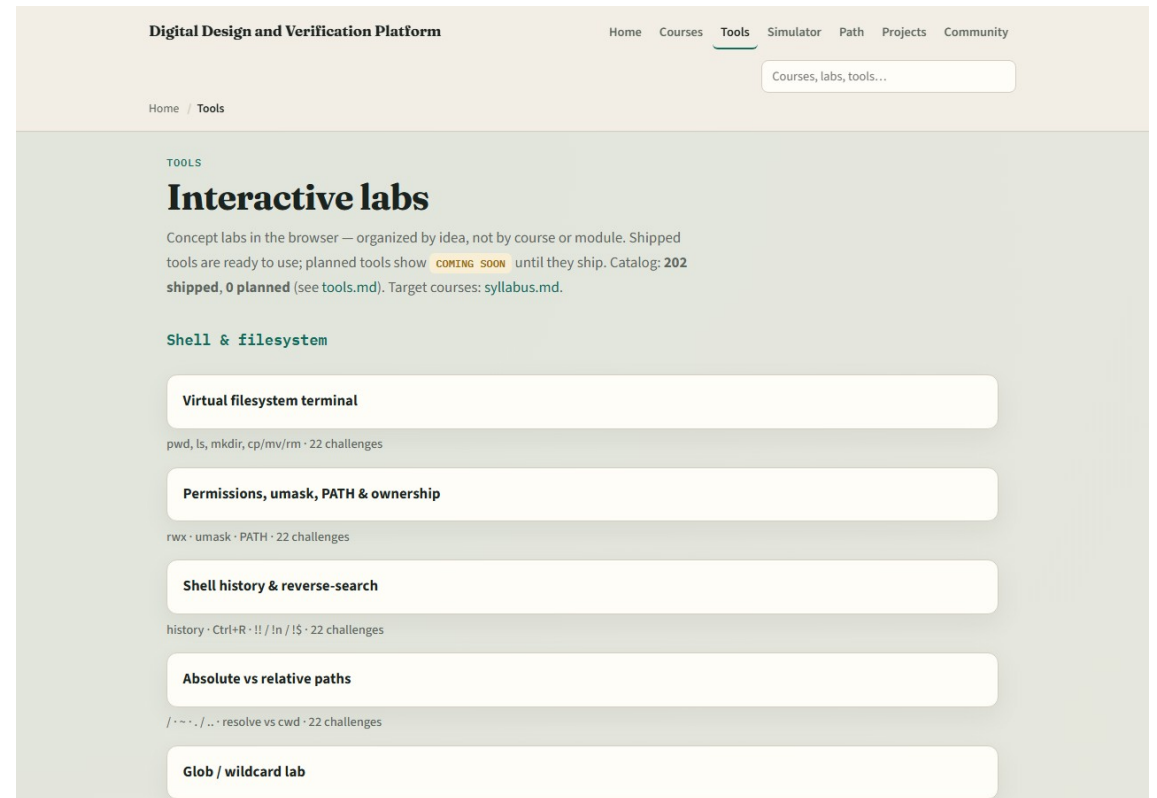

You now have a working map of the browser HDL Simulator path

Skills you can reuse

- Files, Hierarchy, Signals, Wave, and Console are reusable in almost any HDL IDE
- Soft poke versus sticky force, and releasing when done, transfers to professional tools
- Golden compare at a known time is the seed of stronger checking
- Style and synth awareness keeps sim-only habits from becoming silicon surprises

Dual-track recap

- If you mainly used browser labs
- If you mainly used the public simulator, revisit any hdl-sim lab for graded challenges
- Either way, confirm you can open the public simulator without getting lost

Where to go next

- For offline compile and sim fidelity, continue to learn Icarus Verilog or learn Verilator
- For protocol bring-up, UART, SPI, and I²C courses reuse the same wave and TB habits
- For deeper SystemVerilog and UVM, climb the syllabus ladder when you are ready

Mindset to keep

- Prefer tiny DUTs when learning tools
- Read the Console before blaming the RTL
- Never leave forces on
- Know which file is top
- And remember

Closing

- Check off the wrap checklist
- You finished the learn HDL simulator path
- Open the public IDE once more if you want a victory lap
